

SpinUp for New Users

NERSC

<https://www.nersc.gov/systems/spin/>

Welcome

This workshop will prepare you to design, build, and manage your own apps using the Spin platform.

Those might be:

- *database-backed web apps that access project data*
- *workflow orchestration tools running outside of HPC*
- *API servers for real-time or distributed projects*
- *or something else!*

Remember, though: Spin is for *apps*, not computation.

Spin is a Powerful System...

...and with great power comes great responsibility!

- **Keep software updated; fix vulnerabilities promptly.**
 - *NERSC scans regularly to find problems quickly.*
- **Encrypt anything accessible over the network.**
 - *These are strict DOE and DHS requirements!*
- **Produce logs to stdout/stderr.**
 - *This is Docker convention anyway.*

Don't worry. Spin helps make these best practices easy!

Concepts and Terminology

Why Do We Need Spin?

Your project is more than batch jobs and data files; it's science gateways, databases, and other services.

Spin is a supported platform designed to help:

- *Cloud-style flexibility*
- *Create new apps yourself on demand*
- *Redundancy / uptime (97% in 2022)*
- *Direct access to HPC file systems and networks*

Docker, Kubernetes, and Rancher

Spin is based on the Rancher orchestration system, which is built on Docker and Kubernetes.

How do they all fit together?

- Docker is great for just you on a laptop.
- For lots of applications, you need a whole Kubernetes *cluster*.
- For lots of projects, each with lots of applications, we need *orchestration*.
- With Rancher orchestration, you get *virtual private* access to the *multiple* Kubernetes clusters running in Spin.

Without orchestration, a pool of servers and no coordination for users

Managed and assigned to Docker nodes, enabling holistic management, failover, service ownership.

(Some of the) Terminology

Container image: blueprint for a container; like a tarball

Container: running instance of an image; like a process

Image Registry: versioned repository for container images

Pod: one or more very-closely-coupled containers

Workload: set of parameters and rules that define how to create a *particular pod*

Deploy: create a workload

Ingress: proxy service that exposes a web service in a workload externally using a DNS name (layer 7)

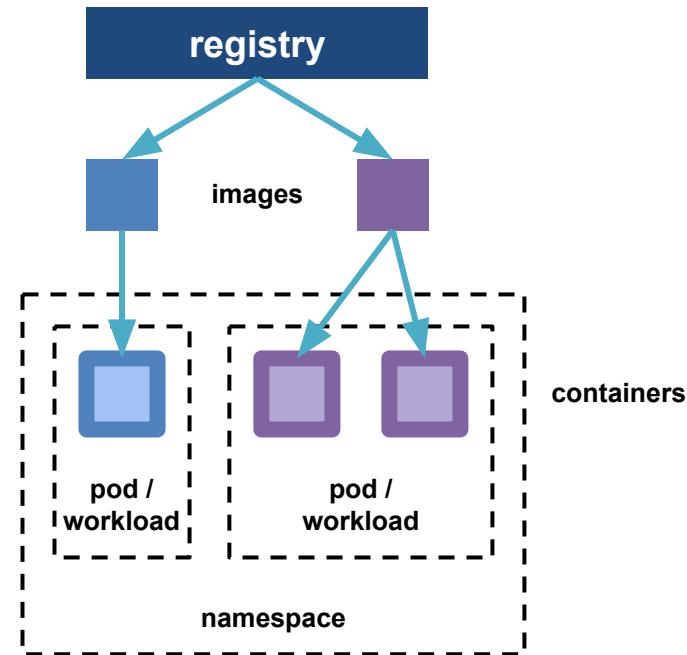

Load Balancer: proxy service that exposes a non-web service in a workload using a DNS name (layer 2)

Namespace: group of workloads (often for interoperation)

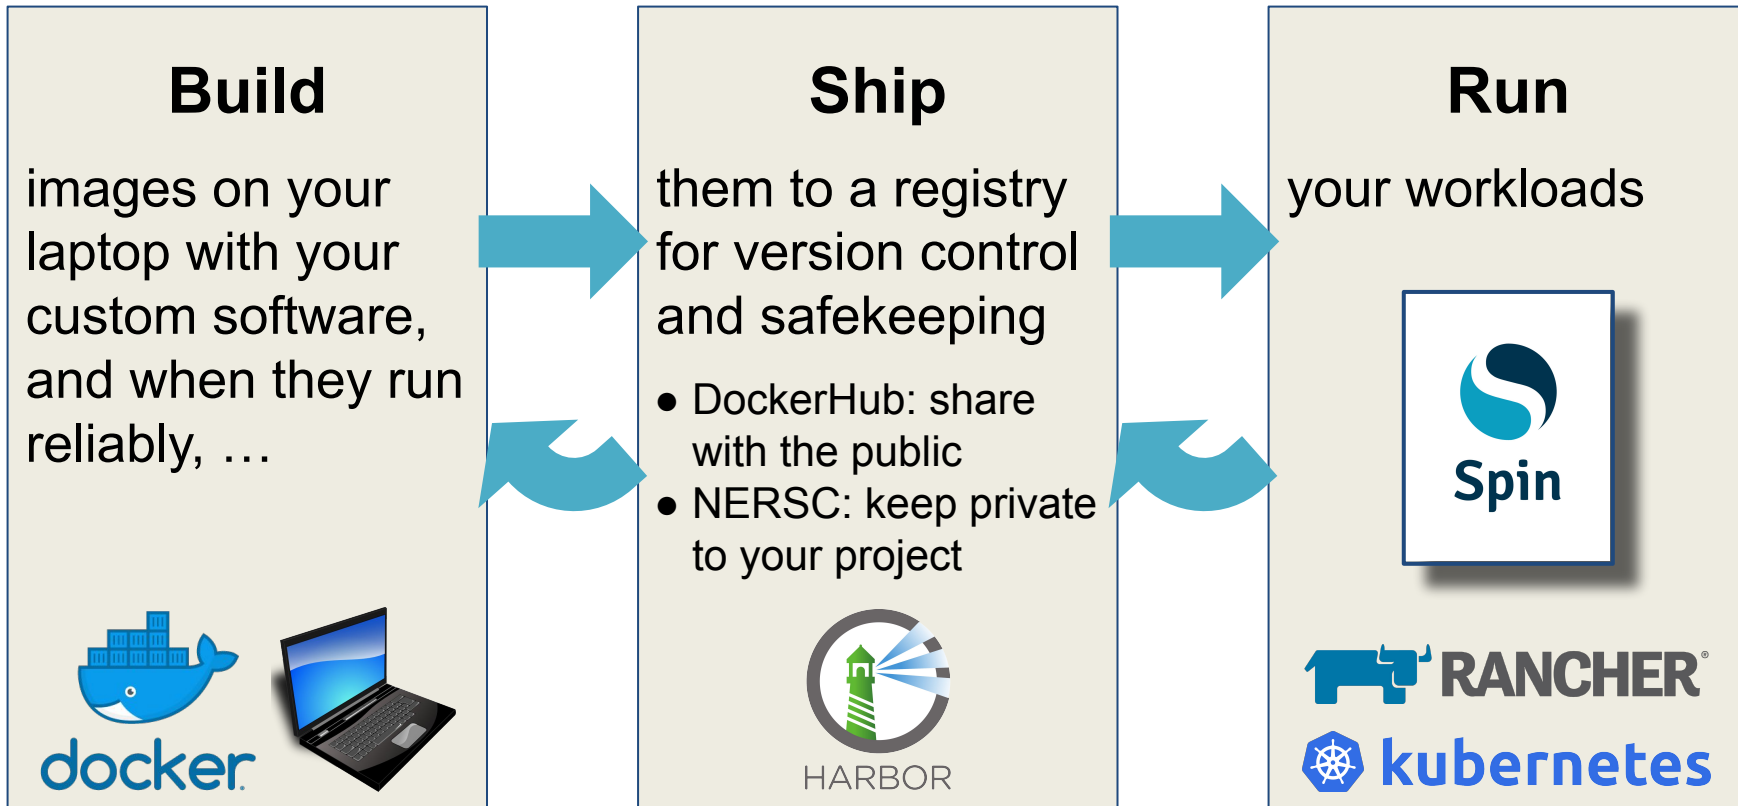

Project: group of workloads, namespaces, ingresses, etc for access control; corresponds to a NERSC project

Kubernetes: container *scheduling* system to run it all

Rancher: *orchestration* system for Kubernetes clusters

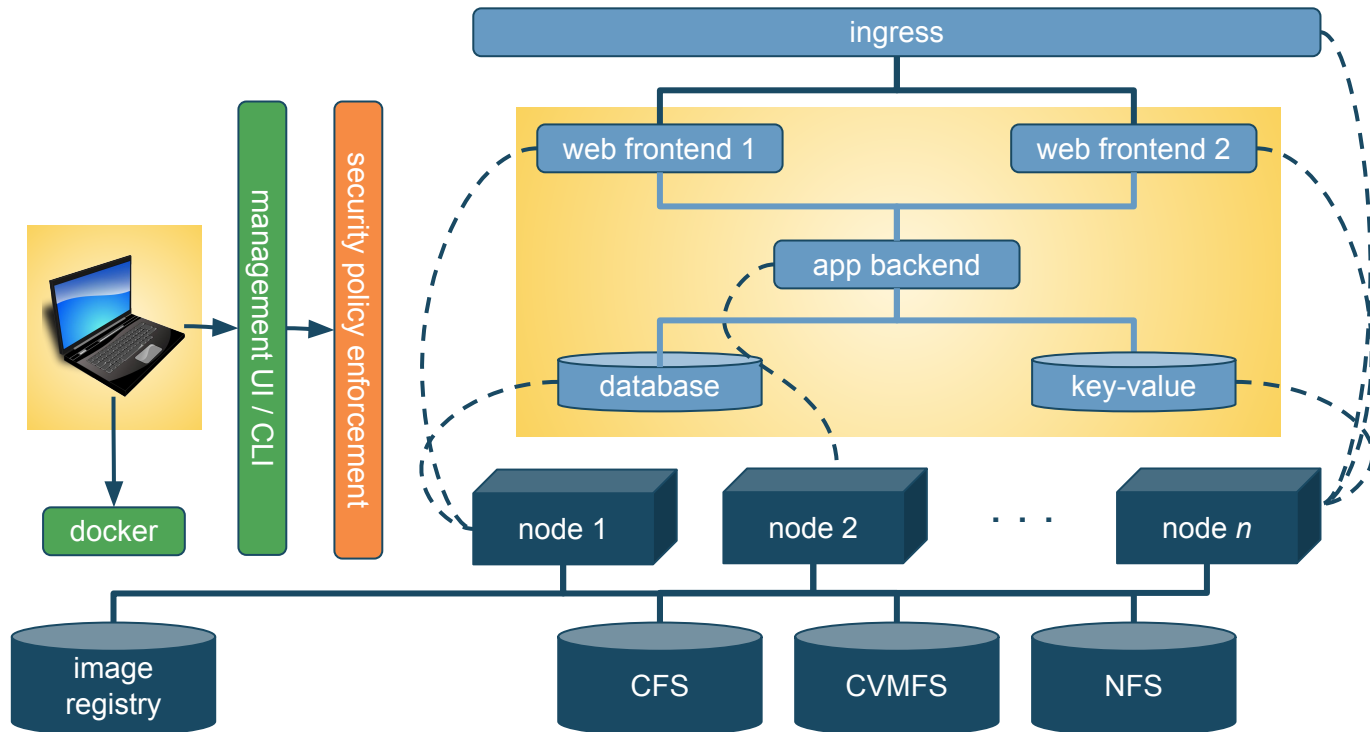

Canonical Development Workflow

High-Level Spin Architecture

Yours to manage

NERSC handles the rest!

Interactive Exercises: Let's Create an App!

Our example app:

- Python-based
- Uses static files in CFS
- Database backend

We will build the app from the bottom up, database first.

Along the way, we will

- Use variables and config maps to customize behavior
- Attach storage
- Store passwords securely
- Make it available on the network

Exercise 1: Create a Database

Exercise 1: Create a Database

- Databases often underlie web apps, so let's start there.
- In Spin, you can access an external database or create your own, as we'll do now.
- We recommend using stock images from DockerHub for MongoDB, MySQL, PostgreSQL, Redis, and others.
 - Frequently updated, easy to customize...less work!
- Look at the README: https://hub.docker.com/_/mysql
 - Customize by setting variables; no custom image needed

Welcome to Rancher

Getting Started ✕

Take a look at the quick getting started guide. For Cluster Manager users, learn more about where you can find your favorite features in the Dashboard UI.

[Slack](#)

[File an Issue](#)

Clusters 2

[Import Existing](#)

[Create](#)

State ⌵	Name ⌵	Provider ⌵	Kubernetes Version	CPU ⌵	Memory ⌵	Pods ⌵
Active	development	Custom RKE	v1.20.15	64 cores	251 GiB	566/800
Active	production	Custom RKE	v1.20.15	1024 cores	31 TiB	768/1600

Try It Yourself!

1. Log in to <https://rancher2.spin.nersc.gov>.
2. In the sidebar under , select **development**, then click **Projects/Namespaces**.
3. Under your project (or if attending the SpinUp Workshop, under the **spinup** project), click **Create Namespace**. Enter a unique name, then click **Create**. *Note: underscores (_) are not allowed!*
4. In the sidebar under **Workload**, click **Deployments** and click **Create**. Select the namespace you just created and enter
Name: **db**
Container Image: **mysql:5**
5. Under Ports, click **Add Port** and enter
Service Type: **Cluster IP**
Name: **mysql**
Private Container Port: **3306**
Protocol: **TCP**
6. Scroll down to **Environment Variables**, click **Add Variable**, and enter
MYSQL_DATABASE = science
MYSQL_USER = user
MYSQL_PASSWORD = password1234
MYSQL_RANDOM_ROOT_PASSWORD = yes
TZ = US/Pacific
7. In the left panel, click **Security Context** and select
Privilege Escalation: **No**
Add Capabilities: **CHOWN, DAC_OVERRIDE, FOWNER, SETGID, SETUID**
Drop Capabilities: **ALL**
8. Click **Create**.
9. Under the  menu to the right of your workload, select **Execute Shell** and enter

```
# mysql -u user -D science -p  
(enter password from above)  
mysql> create table t(n integer);
```

Discussion

- Terminology: You **deployed** a new **workload** in a new **namespace** in a **project** on the *development cluster*. It has one **pod** running one **container** based on the stock MySQL **image**.
- Good stock images make life easy, but be prepared to
 - Read the READMEs for how to set variables
 - Look inside with `docker exec -it image /bin/bash`
- Shell access is easy; no ssh daemon required.

Discussion

Capabilities are root powers; Spin allows them selectively.

Later, we'll discuss how capabilities are limited even further when using global file systems.

Capability	Meaning
CHOWN	Change the owner of files and directories
DAC_OVERRIDE	Override file permissions
FOWNER	Override owner permissions
NET_BIND_SERVICE	Open network ports numbered < 1024
SETGID	Change the group of a running process
SETUID	Change the user of a running process

Exercise 2: Add a Secret

Exercise 2: Add a Secret

- The password seems a little too exposed. Is there a better way to handle things I want to keep secret?
- How can I see what's happening with my service? How can I see logs?
- What happens when I change a workload? Are there any gotchas I should watch out for?

Rancher × +

Active	db	mysql:5	1/1	1	1	0	8 mins	🟢

Cluster Tools

v2.6.11

Try It Yourself!

1. In the sidebar, select **Storage > Secrets**. Click **Create**.
2. Select **Opaque**.
3. Set Values:
Namespace: Choose the namespace you created earlier.
Name: `db-password`
Key: `password`
Value: `<make-something-up>`
4. Click **Create**.

Create the secret

1. Click on **Workload > Deployments**, open the  menu to the right of your workload, and select **Edit Config**.
2. Click **Pod** (to the left of "container-0"), then **Storage**; click **Add Volume**; select **Secret**.
3. Set Values:
Volume Name: `vol-db-password`
Secret: select `db-password`
4. **DO NOT** click **Save** yet!
5. Click **container-0**, then **Storage**. Click **Select Volume** and choose `vol-db-password`.
6. Set **Mount Point** to `/secrets`.
7. Click **Save**.

Attach the secret

Use the secret

1. In the  menu for your workload, choose **Execute Shell** to look at the results:

```
# cat /secrets/password
```
2. In the  menu, select **Edit Config**, expand **Environment Variables**, and replace `MYSQL_PASSWORD:`
`password1234` with `MYSQL_PASSWORD_FILE:`
`/secrets/password`
3. Click **Save**
4. To test the secret, click on your workload (`db`), select **Execute Shell**, and connect using the new password:

```
# mysql -u user -D science -p
```
5. Notice: starting a new pod re-initiated the database!

```
mysql> show tables;  
Empty set (0.00 sec)
```
6. To view logs, click on name of the pod "db", and then select  > **View Logs**

Discussion

- Secrets are a good way to manage and protect passwords, tokens, etc
- View Logs can help you understand and monitor your deployments
- Containers are ephemeral unless you use other storage methods (next)

Exercise 3: Add NFS Storage

Exercise 3: Add NFS Storage

Remember, Docker containers are ephemeral. Your changes go away when a new container is started. Persistent storage can allow you to make changes stick.

NFS Storage in Spin is

- High performance
- High availability (same as Spin itself)
- Mountable into >1 workload (even across namespaces)
- Mounted only on Spin (not other NERSC systems)

Another option: NERSC Global Filesystems (coming up)

Welcome to Spin Rancher 2. Please see the documentation at <https://docs.nersc.gov/services/spin/>

Project: spinup

Deployments

Cluster: development

Buttons: Redeploy, Download YAML, Delete

Filter

State	Name	Image	Ready	Up-to-date	Available	Restarts	Age	Health

Active	app	registry.nersc.gov/spinup/galaxies	1/1	1	1	0	12 days		⋮
Active	db	mysql:5	1/1	1	1	0	12 days		⋮
Active	jeffapp	ubuntu	1/1	1	1	0	12 days		⋮
Namespace: mydb2									
Active	db	mysql:5	1/1	1	1	0	19 days		⋮
Namespace: shalapp									
Active	db	mysql:5	1/1	1	1	0	26 days		⋮
Namespace: unique-newyork									
Active	db	mysql:5	1/1	1	1	0	27 mins		⋮

Cluster Tools

v2.6.11

Try It Yourself!

Create and Mount the NFS Volume

1. In the sidebar under **Workload**, click **Deployments**, find your namespace, and click your **db** workload.
2. Under the  menu at the top right, click **Edit Config**; click **Pod**; in the left panel, click **Storage**.
3. Click **Add Volume**, select **Create Persistent Volume Claim**, and enter or select
Persistent Volume Claim Name: *any name*
Select **Use a Storage Class to provision...**
Storage Class: **nfs-client**
Access Modes: **Single-Node Read/Write**
Capacity: **1 GiB**
Volume Name: *any name, all lowercase*
4. Click **container-0**; in the left panel, click **Storage**.
5. Click **“Select Volume”** and choose the volume claim you just created.

6. Under **Mount Point**, enter `/var/lib/mysql`.
7. Leave **Sub Path in Volume** blank.
8. Click **Save**.

Test the Persistent Volume

1. Under the  menu, select **Execute Shell**, and create a table like you did before:

```
# mysql -u user -D science -p
mysql> create table t(n integer);
```
2. Under the  menu, click **Redeploy** and wait for the new container to be started.
3. Select **Execute Shell** again and check whether your changes persisted:

```
# mysql -u user -D science -p
mysql> show tables;
```

Discussion

- NFS Storage enables data to persist across container instances.
- They allow persistent, performant, read-write storage.
- They are not mounted elsewhere, so you may need to set up a utility container for backups, permission changes.
- They are best used when the data are not needed across NERSC systems.

Exercise 4: Add a Web Front-end and CFS

Exercise 4: Add a Web Front-end and CFS

- Most use cases for Spin are apps that expose data on CFS or functionality at NERSC over the web.
- We've created one in a Docker image that uses:
 - Flask to handle HTTP requests, routing, responses
 - Pretty simple galaxy cluster gallery app
 - Config map for setting some environment variable
 - Database for content and metadata
 - Stored on NFS
 - Image files for web front-end to serve up
 - Stored on CFS

Namespace: unique-newyork										
<input type="checkbox"/>	Active	db	mysql:5	1/1	1	1	0	46 mins		⋮

Try It Yourself!

1. **Storage > ConfigMaps** then **click** “Create” then **set**:

Namespace: <your namespace>
Name: any name

2. **Set** “Data” key/value pair:

banner_message = something hilarious

3. **Click** “Create” button

Config Map

1. **Workload > Deployments** then **click** “Create” then **set**

Namespace: <your namespace>
Name: app

Under “container-0” tab in bottom middle **set**

Container Image: registry.nersc.gov/spinup/galaxies

2. **Scroll down** to “Environment Variables” to add 2 variables:

Click “Add Variable,” and **set**

Type: Key/Value Pair
Variable Name: MYSQL_PASSWORD_FILE
Value: /secrets/password

Click “Add Variable,” and **set**

Type: ConfigMap Key
Variable Name: BANNER_MESSAGE
ConfigMap: <your config map>
Key: banner_message

3. **Scroll up** and **click** “Pod” tab and then **click** “Storage”

to configure two new volumes:

Open “Add Volume” dropdown, **select** “Bind-Mount” and **set**

Volume Name: vol-galaxydata

Path on the Node:

/global/cfs/cdirs/mpccc/rthomas/spin-demo/static

The Path on the Node must be: An existing directory

Open “Add Volume” dropdown, **select** “Secret” and **set**

Volume Name: vol-dbsecret Secret: db-password

4. **Click** “container-0” tab and then **click** “Storage”

to attach new volumes to the Deployment

Open “Select Volume” dropdown, **select** “vol-galaxydata”, and **set**

Mount Point: /srv/static Read-Only: [✓]

Open “Select Volume” dropdown, **select** “vol-dbsecret”, and **set**

Mount Point: /secrets Read-Only: [✓]

5. At “container-0” tab **click** “Security Context” and **set**

Run as User ID: <numeric user ID>

Drop Capabilities: ALL

6. **Click** “Pod” tab and then “Security Context” and **set**

Filesystem Group: <numeric group ID>

7. **Click** “Create” button

To find your numeric user ID and a suitable numeric group ID, use the `id` command on a login node or go to [lris](#) and check the Profile and Groups tabs.

App Workload

Discussion: App, Behind-the-Scenes

- Where did the image come from?
 - Built image locally
 - <https://github.com/NERSC/spin-docker-compose-example>
 - Contains the app.py code, Dockerfile, entrypoint, etc.
 - Image data included too though this is for demonstration only
 - Push to registry.nersc.gov/<project>/<image-name>:<tag>
- How was the database initialized?
 - “Before first request” Flask decorator:
 - Connect to the database
 - Try to create the data table and fill with data
 - Not a robust error check here, it’s a demo
 - Do this because the app container might restart

Discussion: Global File Systems

- **Using global file systems such as CFS triggers stricter security!**
 - Set User ID to yourself or a collab user;
 - Set Filesystem Group to one you belong to
Otherwise, projects' files could be exposed
 - Only one capability allowed: NET_BIND_SERVICE
Otherwise, file system permissions could be bypassed
- **Set o+x permissions from file system root to mount point**
- **Best practices**
 - use read-only access unless you *specifically* need read/write
 - mount as deep into the path as possible
 - use collab users
 - use setgid (chmod g+s) and a group-friendly umask (eg, 007)

Discussion: Storage Options

Storage Type	Persistent	On HPC	Size	Best Use
<i>Global File Systems (Homes, CFS)</i>	✓	✓	O(quota)	sequential
<i>NFS</i>	✓		O(10GB)+	random
<i>CVMFS (read-only) always mount at root!</i>	✓	✓	n/a	CERN software
<i>in-container</i>			O(1GB)	temporary

Discussion: Storage Options

Storage Need	Best Option
Data produced by compute jobs and used by science gateway	Global file system
Static web content or config files that require occasional updates	Global file system*
Web service access logs to analyze and save for record-keeping	Global file system*
Database tablespace or key-value backing store files	NFS
Static application code and web style sheets	in-container
Small, ephemeral application cache files	in-container

What other examples? What are some exceptions?

Exercise 5: Networking

Exercise 5: Networking (Internal / Overlay)

Traffic between containers uses a **private overlay network**.

- Each container gets an IP within 10.42.*.*
- IPs change when new containers are created!
- DNS names are automatically created (and updated)

`<workload>[.<namespace>[.svc.cluster.local]]`

=> 10.42.x.y

For example, the database in our example app:

`db.<namespace>.svc.cluster.local`, or simply

`db`

Exercise 5: Networking (External Inbound)

HTTP traffic requires an *Ingress*.

- When you create an ingress, a dynamic DNS name is associated with it; the workload(s) you specify become accessible on port 80.

`<ingress name>.<namespace>.<cluster>.svc.spin.nersc.org`
=> ingress controller IP address(es)

- You must add a friendly name and matching web certificate.
- Redirection to HTTPS happens automatically.
- Many aspects can be configured with *annotations*.

Exercise 5: Networking (External Inbound)

Non-HTTP traffic requires a *Load Balancer*.

- A dynamic DNS name is associated with the workload; it becomes accessible at the port you specify

```
<workload>-loadbalancer.<namespace>.<cluster>.svc.spin.nersc.org  
=> 128.55.212.* (dedicated IP for this load balancer)
```

- Only accessible from NERSC networks.
- Common ports are allowed; let us know if you need others:

3306, 4873, 5432, 5672, 5984, 15672, 27017

Outbound external traffic just works (via NAT).

Try It Yourself!

1. **Workload > Deployments** in left navigation menu
2. Click the  menu to the right of your “app” workload. and **select** “Edit Config”
3. In “container-0” tab, **scroll down, click** “Add Port” button and **set**

Service Type:	Cluster IP	Name:	flask
Private Container Port:	5000	Protocol:	TCP

Create a service

4. Click “Save” button in the lower left to redeploy “app”.

1. **Service Discovery > Ingresses** in left navigation menu
2. Click the “Create” button in the upper right
3. **Set** these values

Namespace:	<Namespace from previous exercise>		
Name:	ingress		
Request Host:	ingress.<namespace>.development.svc.spin.nersc.org		
Path:			
Prefix:	/	<i>Watch out for leading or trailing spaces</i>	
Target Service:	app		
Port:	5000		

Create the ingress

4. Click “Create” button in the lower left.

You are back at the **Service Discovery > Ingresses** screen

Use the ingress

1. **Wait** for state tag to change to **Active**
2. **Wait** for DNS to propagate to the LBL/NERSC and other DNS servers (**Usually 1-5 minutes**)
3. **Access** your app at: <http://ingress.<namespace>.development.svc.spin.nersc.org>

Exercise 5: Add a Friendly Hostname

Example: **www.cosmosgallery.org**

1. Request a DNS CNAME record in this format from your DNS provider:

`<friendly name> CNAME`

`<ingress>.<namespace>.<development or production>.svc.spin.nersc.org.`

For example,

`www.cosmosgallery.org CNAME lb.cosmosapp.production.svc.spin.nersc.org.`

This will typically take a day or more.

2. Configure Ingress to accept traffic destined for that hostname:
 - a. In your Ingress => Add Rule
 - b. Add the friendly hostname as a second "rule"
 - For HTTPS, the hostname **must** match name in certificate

Rancher

Cluster Tools

v2.6.11

Try It Yourself Later: Add a Friendly Name and SSL

Friendly Hostname

1. Get a CNAME entry from your DNS provider that points at your ingress. For instance:

```
<friendly name> CNAME  
lb.<namespace>.<cluster>.svc.spin.nersc.org
```

2. When it is ready (hours or days later), navigate to **Service Discovery > Ingresses** in Rancher.
3. Click the  icon next to your ingress, and select “Edit Config” from the dropdown
4. Click **Add Rule**.
5. For **Request Host** enter the CNAME. Do not alter the existing rule.
6. Select the same **Path**, **Target Service** and **Port** as in the existing ingress rule, then click **Save**.

SSL/TLS (HTTPS)

1. Get a web certificate from your provider. There are many tutorials on how to do this.
2. Navigate to **Storage > Secrets**, click the **Create** button, then click **TLS Certificate**.
3. Enter a meaningful **Name** and select a **Namespace** scope.
4. Upload your **Private Key** and **Certificate** using “Read from File” buttons and click **Create**.
5. Navigate to **Service Discovery > Ingresses**.
6. **Edit** the ingress, select **Certificates** panel, click **Add Certificate**, select your certificate from the list, add your hostname, and **Save**.

Try It Yourself Later: Add a Load Balancer

1. Under **Workload**, click **Deployments** and click your **db** workload; under the  menu, click **Edit Config**; in the header, click **container-0**; in the left panel, click **General**. Scroll down to **Ports**.

2. Modify the existing port

Service Type:	Load Balancer
Name:	mysql
Private Container Port:	3306
Protocol:	TCP
Listening Port:	3306

Only common ports are exposed!
(Don't pick your "favorite" port here)

3. Click **Save**.

4. Under **Service Discovery**, click **Services** and find your namespace; your load balancer will be named **db-loadbalancer**.

5. Just like an ingress, Rancher will create a DNS name for the load balancer based on the workload name, namespace, and cluster name. To see this generated name, click **db-loadbalancer**, then **Show # annotations** near the top of the page.

6. To try connecting to the database via the load balancer, log into Perlmutter and run

```
% mysql -p -u user -D science -h db-loadbalancer.namespace.development.svc.spin.nersc.org
```

Discussion: Networking

- **Beware of DNS propagation delays**
 - Wait a minute for the DNS name of a *brand new* ingress or load balancer to be created; Rancher uses an internal queue.
 - Accessing either too early can negative cache for five minutes.
- **Custom hostnames and web certificates**
 - Processes vary for obtaining a hostname and certificate.
 - Check with your institution or PI.
- **Web certificate chain ordering**
 - If your certificate requires a chain, use nginx ordering: your certificate first, then that of its issuer, etc, but omitting the root.

Viewing Logs and Performance Data

Viewing Logs, Events & Conditions

Log Type	Content	Where	Best Use
Container	All stdout and stderr from container processes	<p>Option #1: Workload > Deployments, click on the name to view the pods, select View Logs under (⋮) menu next to pod</p> <p>Option #2: Workload > Pods, select View Logs under (⋮) menu next to pod</p>	<p>Application problem, but container runs</p> <p>Container produces error at startup, exits, and restarts</p>
Workload Events, Pod Conditions	Scheduler activity (start, stop, scale), node failure	<p>Workload > Deployments > (Your Deployment) and choose one of:</p> <ul style="list-style-type: none"> • Recent Events • Conditions 	<p>Workload will not start or scale at all</p> <p>Container restarts continuously</p> <p>Denied due to security policy</p>

Wrap-Up

High-Level Spin Architecture

Yours to manage

NERSC handles the rest!

Roles and Responsibilities

You bring...

- **Your own microservice design**
- **Your own services based in Docker images**
- **Lifecycle management**
 - maintain at least one owner for every application
 - track Docker build files with git
 - minimize image customizations
- **Security management**
 - produce logs to stdout / stderr
 - use trustworthy public images; keep custom images updated
 - NERSC will scan images and network ports

Roles and Responsibilities

NERSC brings...

- **Stable infrastructure**
 - redundancy: 2x power, 2x network
 - dedicated storage
 - access to global file systems
- **Management practices for high uptime**
 - rolling upgrades
 - pre-scheduled quarterly maintenance
- **Support via the usual channels**
 - Spin team spans NERSC groups
 - NERSC staff are also Spin users!
