Running Containers at NERSC with Shifter

Shane Canon
NERSC Early User Training Day 2018
March 21, 2018
Outline

• Quick Intro to Containers
• Role of Shifter
• Walk through of using Docker and Shifter
Intro to Containers and Shifter
Docker Basics

- Build images that captures applications requirements.
- Manually commit or use a recipe file.
- Push an image to DockerCloud, a hosted registry, or a private Docker Registry.
- Share Images
- Use Docker Engine to pull images down and execute a container from the image.
What’s in an Image

• Directory tree
  – Base Linux OS
  – Libraries, binaries, tools, scripts, etc
  – User code
  – Data

• Run-time Settings
  – Environment variables
  – Working Directory
  – Default execution and parameters

• Other things (not relevant to Shifter)
  – Network-related (e.g. ports)
  – Run User
Why not just run Docker

• Security: Docker currently uses an all or nothing security model. Users would effectively have system privileges

> docker run -it -v /:/mnt --rm busybox

• System Architecture: Docker assumes local disk
• Integration: Docker doesn’t play nice with batch systems.
• System Requirements: Docker typically requires very modern kernel
• Complexity: Running real Docker would add new layers of complexity
Shifter

- NERSC R&D effort, in collaboration with Cray, to support Docker Application images
- “Docker-like” functionality on the Cray and HPC Linux clusters
- Addresses security issues in a robust way
- Efficient job-start & Native application performance
Why Users will like Containers and Shifter

• Develop an application on your desk top and run it on Cori and Edison
• Enables you to solve your dependency problems yourself
• Run the (Linux) OS of your choice and the software versions you need
• Improves application performance in many cases
• Improve reproducibility
• Improve sharing (through sites like Dockerhub)
Containers and Science

• Reproducibility
  – Everything you need to redo a scientific analysis
  – Image manifest contains all information about environment
    • Scripts, portable input files can be managed with version controller for greater control

• Portability
  – Runs on every system

• Reduction of Effort
  – Compile takes 10 hours? Just do it once and share it with everyone
  – System doesn’t have the right library version? Yum install or apt-get it yourself in the container
Shifter in Action
FROM ubuntu:14.04
MAINTAINER Shane Canon scanon@lbl.gov

# Update packages and install dependencies
RUN apt-update -y && \\   apt-get install -y build-essential

# Copy in the application
ADD . /myapp

# Build it
RUN cd /myapp && \\   make && make install

laptop> docker build -t scanon/myapp:1.1.
laptop> docker push scanon/myapp:1.1
#!/bin/bash
#SBATCH -N 16 -t 20
#SBATCH --image=scanon/myapp:1.1

module load shifter
export TMPDIR=/mnt
srun -n 16 shifter /myapp/app

cori> shifterimg pull scanon/myapp:1.1
cori> sbatch ./job.sl
Shifter and MPI

- Shifter has a “built-in” approach for supporting MPI applications in containers.
- Build Applications using ABI compatibility.
- Shifter automatically maps in appropriate libraries at run time.
- No rebuild required, but may not work for all cases.
- Can provide native MPI performance.
# This example makes use of an Ubuntu-based NERSC base image
# that already has MPI built and installed.

FROM nersc/ubuntu-mpi:14.04

ADD helloworld.c /app/

RUN cd /app && mpicc helloworld.c -o /app/hello

ENV PATH=/usr/bin:/bin:/app:/usr/local/bin

> shifterimg pull scanon/myapp:1.1
> salloc -n 128 --image=scanon/myapp:1.1 --C haswell
# srun -n 128 shifter /myapp/app
Shifter accelerates Python Apps

Pynamic v1.3, 4800 MPI ranks

- Cori P1
- Edison

</tr>
</tbody>
</table>
Shifter behavior versus Docker

• Processes run as your user id (not root).
• Images are mounted read-only (so you modify files in the image).
• Home directories and global file systems are automatically mounted.
• Some handling of special Dockerfile directives isn’t yet supported
Other things of Note

- Shifter supports volume mounts that allow you to map a directory (e.g. $SCRATCH) into another location in your image.
- Shifter supports per-Node writeable scratch spaces that work well for apps that want a local disk.
- NERSC runs a private registry (registry.services.nersc.gov) that can be used to store private images that you can’t put in DockerHub.
## Shifter versus Spin

<table>
<thead>
<tr>
<th>Shifter</th>
<th>Spin</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Runs processes as the user</td>
<td>• Runs with stock Docker and Rancher</td>
</tr>
<tr>
<td>• Runs on the HPC systems</td>
<td>• Runs on dedicated hardware</td>
</tr>
<tr>
<td>Best for:</td>
<td>Best for:</td>
</tr>
<tr>
<td>• Simulation or analysis runs</td>
<td>• Running services or processes that need to run “indefinitely”</td>
</tr>
<tr>
<td>• Need to run at scale</td>
<td>• Services that need to be externally accessible</td>
</tr>
<tr>
<td>• Need to read/write a lot of data</td>
<td></td>
</tr>
</tbody>
</table>
Measuring the Composition of the Universe

- **CMB – S4**
  - Ambitious collection of telescopes to measure the remnants of the Big Bang with unprecedented precision

- **Simulated 50,000 instances of telescope using 600,000 cores on Cori KNL nodes.**

- **Why Shifter?**
  - Python wrapped code needs to start at scale
Where can you learn more

- **NERSC Website**
  - For Users
  - Software
  - Using Shifter and Docker

- **Previous Training**
  - [https://github.com/nersc/Shifter-Tutorial](https://github.com/nersc/Shifter-Tutorial)

- **Docker Resources (Numerous)**
  - [https://docs.docker.com/get-started/](https://docs.docker.com/get-started/)
