Parallel debuggers on Cori and Edison

- **Parallel debuggers with a graphical user interface**
 - DDT (Distributed Debugging Tool)
 - TotalView
- **Specialized debuggers on Cori and Edison**
 - STAT (Stack Trace Analysis Tool)
 - Collect stack backtraces from all (MPI) tasks
 - Cray ATP (Abnormal Termination Processing)
 - Collect stack backtraces from all (MPI) tasks when an application fails
- **Valgrind**
 - Suite of debugging and profiling tools
 - Best known for its detailed memory debugging (memcheck)
 - <http://www.nersc.gov/users/software/performance-and-debugging-tools/valgrind/>
- **Intel Inspector**
 - Thread and memory debugging
 - <http://www.nersc.gov/users/software/performance-and-debugging-tools/inspector/>
- **Cray debuggers for comparative debugging**
 - CCDB
 - lgdb

TotalView

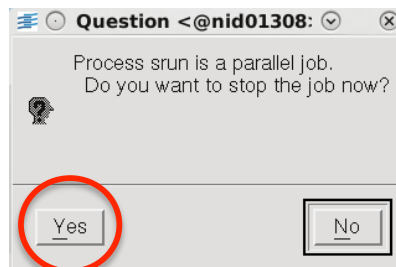

```
$ salloc -N 1 -t 30:00 -q debug -C knl
$ module load totalview
$ export OMP_NUM_THREADS=6
$ totalview srun -a -n 4 ./jacobi_mpiomp
```

Then,

- Click OK in the 'Startup Parameters - srun' window
- Click 'Go' button in the main window

- Click 'Yes' to the question 'Process srun is a parallel job. Do you want to stop the job now?'

TotalView (cont'd)

Root window

State of MPI tasks and threads; members denoted roughly as 'rank.thread'

Process window

For navigation

To see the value of a variable, right-click on a variable to "dive" on it or just hover mouse over it

Breakpoints, etc.

For selecting MPI task and thread

Memory debugging with MemoryScape

- **MemoryScape integrated into TotalView for memory debugging**
 - Memory leaks
 - Memory usage
 - Memory corruption
 - ...

- **A statically-linked executable**

```
$ module load totalview  
$ CC -g -O0 -o memry_leaks memory_leaks.o ${TVMEMDEBUG_POST_OPTS}
```

- **A dynamically-linked executable, build as usual**

```
$ CC -dynamic -g -O0 -o memry_leaks memory_leaks.o
```

Memory debugging with MemoryScape

- Start TotalView and enable memory debugging in the 'Startup Parameters' window
- Proceed to use TotalView as usual
- For memory-related issues, open MemoryScape from the Debug pull-down menu

Memory debugging examples

MemoryScape 2016.07.22 <@nid01308>

STAT (Stack Trace Analysis Tool)

- **Gathers stack backtraces (sequence of function calls leading up to the current function) for all (MPI) processes**
 - Merge them into a single file (*.dot)
 - Results displayed as a single call tree for all processes
 - **Can be useful for debugging a hung application**
 - With the info learned from STAT, can investigate further with DDT or TotalView
- **Works for MPI, CAF and UPC, OpenMP**

- **STAT commands (after loading the 'stat' module)**
 - stat-cl: invokes STAT to gather stack backtraces
 - STATview: a GUI to view the results
 - STATGUI: a GUI to run STAT or view results
- **For more info:**
 - 'intro_stat', 'STAT', 'STATview' and 'STATGUI' man pages
 - /opt/cray/pe/stat/default/doc/stat_userguide.pdf
 - <http://www.nersc.gov/users/software/performance-and-debugging-tools/stat-and-atp/>

Debug a hung application with STAT

- If your code hangs in a consistent manner, you can use STAT to see where some MPI ranks are stuck.
- One way to use STAT is as follows.

```
$ ftn -g -o jacobi_mpi jacobi_mpi.f90          with usual optimization flags, if any
$ salloc -N 2 -t 30:00 -q debug -C knl
```

...

```
$ srun -n 4 ... ./jacobi_mpi &
```

```
[1] 142927
```

```
$ module load stat
```

```
$ stat-cl -i 142927
```

-i to get source line numbers

STAT samples stack backtraces a few times

```
...
Attaching to application...
Attached!
Application already paused... ignoring request to pause
Sampling traces...
Traces sampled!
```

```
...
Resuming the application...
Resumed!
Merging traces...
Traces merged!
Detaching from application...
Detached!
```

Results written to /global/cscratch1/sd/wyang/debugging/stat/stat_results/jacobi_mpi.0003

```
$ ls -l stat_results/jacobi_mpi.0003/*.dot
```

```
-rw-r--r-- 1 wyang wyang 2724 Apr 23 17:34 stat_results/jacobi_mpi.0003/00_jacobi_mpi.0003.3D.dot
```

```
$ STATview stat_results/jacobi_mpi.0003/00_jacobi_mpi.0003.3D.dot
```

Debug a hung application with STAT (Cont'd)

Cray ATP (Abnormal Termination Processing)

- **ATP gathers stack backtraces from all processes *when an application fails***
 - Invokes STAT underneath
 - Output in atpMergedBT.dot and atpMergedBT_line.dot (which shows source code line numbers), which are to be viewed with STATview
- **The atp module is loaded on Cori and Edison by default, but ATP is not enabled; to enable:**

```
export ATP_ENABLED=1      # sh/bash/ksh
setenv ATP_ENABLED 1      # csh/tcsh
```

- **Can get core dumps (core.atp.jobid.rank), too, by setting coredumpsize unlimited:**

```
ulimit -c unlimited      # sh/bash/ksh
unlimit coredumpsize      # csh/tcsh
```

but they do *not* represent the exact same moment in time (therefore the location of a failure can be inaccurate)

- **For more info**
 - ‘intro_atp’ man page
 - <http://www.nersc.gov/users/software/debugging-and-profiling/stat-and-atp/>

Use ATP for hung application

- Abort a hung application to generate backtraces
- For the following to work, must have used
 - 'export ATP_ENABLED=1' in batch script
 - 'export FOR_IGNORE_EXCEPTIONS=true' in batch script for Intel Fortran
 - '-f no-backtrace' at compile/link time for GNU Fortran

```
$ sacct -j 11091158 Find the job step ID
```

JobID	JobName	Partition	Account	AllocCPU	State	ExitCode
-------	---------	-----------	---------	----------	-------	----------

...						
11091158.0	jacobi_mp+		nstaff	4	RUNNING	
...						

```
$ ssh cmom02 Kill the application on a MOM node
```

```
$ scancel -s ABRT 11091158.0
```

```
$ exit
```

```
$ cat slurm-11091158.out
```

Application 11091158 is crashing. ATP analysis proceeding...

...
Process died with signal 6: 'Aborted'

View application merged backtrace tree with: stat-view atpMergedBT.dot

...

```
$ module load stat
```

```
$ STATview atpMergedBT.dot # or statview atpMergedBT_line.dot
```

Use ATP for hung application (Cont'd)

- Force to generate backtraces from a hung application
- For the following to work, must have used
 - 'export ATP_ENABLED=1' in batch script
 - 'export FORTRAN_IGNORE_EXCEPTIONS=true' in batch script for Intel Fortran
 - '-fno-backtrace' at compile/link time for GNU Fortran

`$ sacct -j 11091158` find the job status

JobID	JobName	Partition	Account	All CPUs	State	ExitCode
-------	---------	-----------	---------	----------	-------	----------

...
11091158.0 jacobi_mp+ instiff 4 RUNNING

`$ ssh cmom02`

Kill the application on CMOM node

`$ scancel -s ABRT 11091158.0`

`$ exit`

`$ cat slurm-11091158.out`

Application 11091158 is crashing. ATP analysis proceeding...

...
Process died with signal 6: 'Aborted'

View application merged backtrace tree with: `stat-view atpMergedBT.dot`

`$ module load stat`

`$ STATview atpMergedBT.dot` # or `statview atpMergedBT_line.dot`

Anything can be done in the meantime?

- **A script provided in stat_userguide (p.40)**
 - Launches the application in background
 - If the app runs much longer than expected (that is, it's possibly hanging), then run stat-cl on it
- **A practically same script below**
- **Be careful as run times can fluctuate**

```
#!/bin/bash
#SBATCH -N 2
#SBATCH -t 10
#SBATCH -q debug
#SBATCH -C knl

stat_wait_time_minutes=5 # exp. run time in minutes
application_exited=0

#run the application and get the launcher PID
export OMP_NUM_THREADS=1
#...
srun -n 4 -c 128 ./a.out &
pid=$!
```

```
# periodically check for application exit
for i in `seq ${stat_wait_time_minutes}`
do
    sleep 60
    ps -p ${pid}
    if test $? -eq 1; then
        # the application exited, so we're done!
        application_exited=1
        break
    fi
done

# if the application is still running then invoke STAT
if test ${application_exited} -eq 0; then
    module load stat
    stat-cl -i ${pid}
    # kill -TERM ${pid}
fi
```

Anything can be done in the meantime?

(Cont'd)

```
$ sbatch runit
```

```
Submitted batch job 11806533
```

```
$ cat slurm-11806533.out
```

```
...
```

```
Attaching to application...
```

```

- Suite of debugging and profiler tools
- Tools include
 - **memcheck**: memory error and memory leaks detection
 - **massif, dhat (exp-dhat)**: heap profilers
 - **cachegrind**: a cache and branch-prediction profiler
 - **callgrind**: a call-graph generating cache and branch prediction profiler
 - **helgrind, drd**: pthreads error detectors
- For info:
 - <http://valgrind.org/docs/manual/manual.html>
 - <http://www.nersc.gov/users/software/performance-and-debugging-tools/valgrind/>

Valgrind's memcheck

```
$ module load valgrind
$ ftn -dynamic -g -O0 memory_leaks.f $VALGRIND_MPI_LINK
$ salloc -N 1 -t 30:00 -q debug -C knl
$ srun -n 2 valgrind --leak-check=full --log-file=%p ./a.out
$ ls -l
```

The code from NERSC DDT webpage

Could have explicitly added '--tool=memcheck'

...

```
-rw-r--r-- 1 wyang wyang 9131 Apr 23 21:09 157465
-rw-r--r-- 1 wyang wyang 7526 Apr 23 21:09 194650
```

- **Let's look at the report for process 157465**

```
$ more 157465
```

...

```
==157465== LEAK SUMMARY:
